Motivation	Subgame Detection ●○○	Impartial Games	General Partial Games	Parallel and Serial Games	Conclusion
Basic Idea					
Basic	Definition	S			

(Game). A **game** is a tuple G = (F, A, I, R) where

- F is a set of fluents,
- A is a set of actions,
- I is the initial state of the game, which is a set of ground instances of F,
- R is a set of roles.

### Definition

(State). A **state** *S* of a game G = (F, A, I, R) is a set of ground instances of *F*, and *S* can be reached from initial state *I* by playing *G*.

Motivation	Subgame Detection ●○○	Impartial Games	General Partial Games	Parallel and Serial Games	Conclusion
Basic Idea					
Basic	Definition	s			

(Subgame). A game G = (F, A, I, R) is a **subgame** of G' = (F', A', I', R') iff  $F \subseteq F', A \subseteq A', I \subseteq I', R \subseteq R'$ , and F, A, I and R are not empty.

### Definition

(Subgame Independence). Two subgames Gs = (Fs, As, Is, Rs) and Gs' = (Fs', As', Is', Rs') of game G are **independent** each other iff  $Fs \cap Fs' = \oslash$  and  $As \cap As' = \oslash$ .

## Impartial Games

- Impartial Property Checking
- Decomposition Search
- 4 General Partial Games
- 5 Parallel and Serial Games

6 Conclusion

An impartial game is an alternating move game and the legal moves of the game only depend on the position (or state) of the game.

- Legal rules
  - if, given any state of the game, the legal rules give the same moves for every player if he has control in that state
- Next rules
  - if, given any state of the game and a move, the next rules give the same next state for every player if he does this move

Motivation	Subgame Detection	Impartial Games	General Partial Games	Parallel and Serial Games	Conclusion		
Impartial Property Checking							

# GDL Game Rule Analysis

- Legal rules
  - if, given any state of the game, the legal rules give the same moves for every player if he has control in that state
- Next rules
  - if, given any state of the game and a move, the next rules give the same next state for every player if he does this move

Counter example (TicTacToe):

Motivation	Subgame Detection	Impartial Games	General Partial Games	Parallel and Serial Games	Conclusion				
Decomposition Search									

# Game Nim and Nimber

### Theorem

(Sprague Grundy theorem). Every impartial game under the normal play convention is equivalent to a nimber.

## Definition

A **nimber** is a special game denoted by \*n for some integer n and  $n \ge 0$ . We define \*0 = {}, and \*(n+1) = \*n  $\cup$  {\*n}. Given two nimbers G and H, nim addition  $G \oplus H = \{G \oplus h | h \in H\} \cup \{g \oplus H | g \in G\}.$ 

Motivation	Subgame Detection	Impartial Games	General Partial Games	Parallel and Serial Games	Conclusion
Decompositio	n Search				

# Game Nim and Nimber

## Definition

A **nimber** is a special game denoted by \*n for some integer n and  $n \ge 0$ . We define \*0 = {}, and \*(n+1) = \*n  $\cup$  {\*n}. Given two nimbers G and H, nim addition  $G \oplus H = \{G \oplus h | h \in H\} \cup \{g \oplus H | g \in G\}.$ 

Nim example:

きょう きょう きょう きょう きょう

Motivation	Subgame Detection	Impartial Games	General Partial Games	Parallel and Serial Games	Conclusion				
Decomposition Search									

# Game Nim and Nimber

## Definition

A **nimber** is a special game denoted by \*n for some integer n and  $n \ge 0$ . We define \*0 = {}, and \*(n+1) = \*n  $\cup$  {\*n}. Given two nimbers G and H, nim addition  $G \oplus H = \{G \oplus h | h \in H\} \cup \{g \oplus H | g \in G\}.$ 

$${}^{*1} = {}^{*0} \cup {}^{*0} = {}^{\cup} \{ \} = {}^{*0}, \\ {}^{*2} = {}^{*1} \cup {}^{*1} = { \{ \} \} \cup { \{ \{ \} \} } = {}^{*0, *1}$$

## Winning Conditions of Nim

the player to make the last move wins (normal play game)

Ithe player to make the last move loses (misère game)

Motivation	Subgame Detection	Impartial Games	General Partial Games	Parallel and Serial Games	Conclusion			
Decompositio	Decomposition Search							

### Theorem

A game is impartial iff its all subgames are impartial.

## Decomposition Search

- Subgame search
  - calculate the nimber of each subgame
- Global game search
  - use nim-addition to find optimal strategies

### Example

(<= (**goal** xplayer 100) (line1 x) (line2 x))

there are two local goal concepts, (line 1 x) and (line 2 x).

Motivation	Subgame Detection	Impartial Games	General Partial Games ○●○○○	Parallel and Serial Games	Conclusion			
Additional Definitions for Decomposition Search								
Turn-Move Sequences								

A turn-move sequence is a tuple Seq = (Ts, Ms, Es) where

- *Ts* is a list of player names, indicated by  $T_1 \circ T_2 \circ ... \circ T_n$ ,
- *Ms* is a list of moves, indicated by  $M_1 \circ M_2 \circ ... \circ M_n$ ,
- Es is a set of evaluations of local concepts, where n ≥ 0.

### Definition

Turn-move sequence  $Seq_1 = (Ts_1, Ms_1, Es_1)$  is **evaluation dominated** by turn-move sequence  $Seq_2 = (Ts_2, Ms_2, Es_2)$ **under** a set of local concepts *Cs* iff

• 
$$Ts_1 = Ts_2$$
,

• 
$$\forall_{C \in Cs}(Seq_1 \models C \Rightarrow Seq_2 \models C).$$

	Done	and ToDo				

## What We Have Done:

- subgame detection algorithm and
- decomposition search algorithms for different classes of games

Motivation	Subgame Detection	Impartial Games	General Partial Games	Parallel and Serial Games	Conclusion		
Done and ToDo							

## What We Have Done:

- subgame detection algorithm and
- decomposition search algorithms for different classes of games

## What Can be Improved:

- apply pruning techniques in decomposition search of partial games, e.g. alpha-beta pruning
- use local concept evaluations more efficiently in global game search

Motivation	Subgame Detection	Impartial Games	General Partial Games	Parallel and Serial Games	Conclusion
Done	and ToDo

# Time Complexity Comparison I

### Impartial and Partial Games

Assume that a game G has n subgames,  $G_1, G_2, ..., G_n$  with  $V_1, V_2, ..., V_n$  states respectively,

- normal search:  $O(V_1 * V_2 * ... * V_n)$
- decomposition search:  $O(V_1 + V_2 + ... + V_n)$

### Example

For double-tictactoe, the number of states is about 18!(including revisited states), while the state for each subgame is about  $\prod_{n=1}^{9} (2n)$  which is  $\prod_{n=1}^{9} (2n-1)$  times smaller than 18!

# Time Complexity Comparison II

## Parallel Games

Assume that a parallel game G has n subgames,  $G_1$ ,  $G_2$ , ...,  $G_n$  with  $V_1$ ,  $V_2$ , ...,  $V_n$  states respectively,

- normal search:  $O(V_1 * V_2 * ... * V_n)$
- decomposition search:  $O(V_1 + V_2 + ... + V_n)$

## Serial Games

Assume that a serial game G has n subgames, for subgame *i* there are  $V_i$  states and  $T_i$  terminal states

onormal search:

 $O(V_1 + T_1 * V_2 + T_1 * T_2 * V_3 + \dots + T_1 * T_2 * \dots * T_{n-1} * V_n)$ 

• decomposition search:  $O(V_1 + V_2 + ... + V_n)$
