Double Auction Design

Why are they so challenging?

The decision-making of the auctioneer

- depends on traders' private information, called type:
 - variable valuation of the commodity/goods
 - dynamical arrival and departure time
 - o ...
- has to satisfy certain properties, e.g. truth-telling, efficiency

faces uncertainty

Double Auc	tion Design				
Mech	nanism Des	sign			

Mechanism design answers...

How to design a mechanism which leads to a desired outcome?

A double auction mechanism consists of...

• an allocation policy, i.e. a matching between asks and bids

a payment policy

Static Double Auctions Approaching Online Double Auctions

Online Double Auctions

Design Goals

What are the Desired Outcomes?

Question

What properties should a double auction satisfy?

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Design Goals

What are the Desired Outcomes?

Question

What properties should a double auction satisfy?

IC Incentive Compatibility (or Truthfulness)

- telling truth is each trader's dominant strategy *Why IC is important?*
 - simplifies traders' decision-making
 - the base to get other properties, e.g. efficiency

Static Double Auctions

My Solution					
The	Problem				

Design Online Double Auctions, where

• traders dynamically arrive and departure the auction

• traders' valuation is changing over time

Real Applications

- Stock Exchange
- Futures Exchange
- Group Buying

Static Double Auctions

Approaching Online Double Auctions

Online Double Auctions Co

My Solution

An Incremental Approach

- Static
 - single-unit demand/supply with fixed valuation
- Approaching Online (without uncertainty)
 - with temporal constraints, e.g. futures exchange
 - temporal constraints limit the allocation/matching
 - under group buying, e.g. Groupon
 - valuation varies in terms of the number of goods exchanged
- Online (with uncertainty), e.g. stock exchange
 - dynamic arrival & departure + fixed valuation
 - 2 dynamic arrival & departure + dynamic valuation

Online Double Auctions

Double Auction with Temporal Constraints

Double Auction with Temporal Constraints

• type:
$$\theta_i = (v_i, s_i, e_i)$$

- v_i is trader i's valuation of a single unit of the commodity
- s_i (e_i) is the starting (ending) point of time constraint [s_i , e_i]
- an ask $\theta_i = (v_i, s_i, e_i)$ and a bid $\theta_i = (v_i, s_i, e_i)$ are matchable iff $v_i \leq v_i$ and $[s_i, e_i] \cap [s_i, e_i] \neq \emptyset$

Application Examples

- Futures Exchange
- Stock Exchange

Trader *i* has valuation function $v_i : \mathbb{Z} \to \mathbb{R}$.

- Seller:
 - unlimited supply
 - monotonic: $v_i(k) \leq v_i(k+1)$
 - group buying discount: $\frac{v_i(k)}{k} \ge \frac{v_i(k+1)}{k+1}$
- Buyer:
 - demands c_i units
 - $v_i(k) = v_i(c_i) > 0$ for all $k \ge c_i$, otherwise $v_i(k) = 0$

Double Auc	tion under Group Buying				
Impo	ssibility I				

given that

 both the trading size and the payment are neither seller-independent nor buyer-independent

there is no auction that is incentive compatible, individually rational and (weakly) budget-balanced.

Why?

buyers want to form a bigger group while sellers might not!

- buyers with larger group will lower their payments
- a seller's profit might not maximised when selling more

Given type profile report $v = (v^B, v^S)$, assume that $v_1^B(1) \ge v_2^B(1) \ge \cdots \ge v_m^B(1)$.

- Let $w(k) = \min \operatorname{argmin}_i v_i^{S}(k)$ and $p(k) = \min_{i \neq w(k)} \frac{v_i^{S}(k)}{k}$ or ∞ if there is only one seller.
- 2 Let $k^* = \max\{k | v_k^B(1) \ge p(k)\}.$
- So The first k^* buyers, i.e. buyers of valuation $v_1^B, v_2^B, \dots, v_{k^*}^B$, receive one unit of the commodity each and each of them pays $p(k^*)$.
- Seller $w(k^*)$ sells k^* units of the commodity and receives payment $p(k^*) \cdot k^*$.
- The remaining traders lose without payment.

Online Double Auctions

- O dynamic arrival & departure + fixed valuation
- Q dynamic arrival & departure + dynamic valuation

with Fixed Valuation

Dynamic Arrival and Departure with Fixed Valuation

• type:
$$\theta_i = (v_i, a_i, d_i)$$

- v_i is trader i's (fixed) valuation of a single unit of the commodity
- a_i (d_i) is the arrival (departure) time of trader i
- an ask $\theta_i = (v_i, a_i, d_i)$ and a bid $\theta_i = (v_i, a_i, d_i)$ are matchable iff $v_i \leq v_i$ and $[a_i, d_i] \cap [a_i, d_i] \neq \emptyset$

 Online Double Auctions
 Online Online Double Auctions

Summary

How did I achieve the results?

Reduction reduce online double auctions to online one-sided auctions

Behaviour-based Design utilize market behaviours of traders to guide market decisions

Augmentation-based Design use augmentation techniques from graph theory to design computationally efficient auctions

Summary

What are the potential impacts of the results?

Static Double Auctions

more applicable allocation in stock exchange

Approaching Online Double Auctions

- augmentation-based
 - application in exchange markets, e.g. futures exchange
- group buying related
 - a guideline for further study of the dynamic problem
- Online Double Auctions
 - an efficient approach to control/guide complex exchange markets

- Group buying with dynamic advertising effect
 - how many buyers will come back?
 - will they tell their friends of the product?
- How to apply the results in real applications
 - how to deal with bounded rationality of human traders?

- Extending the results to other dynamic environments
 - dynamic kidney exchange
 - online advertising
